Introduction

In Kubernetes, an **Ingress** resource defines rules that allow external access to services within a cluster. It acts as a gateway, managing traffic and routing requests based on defined rules. In this lab, you will set up an Ingress resource in a Minikube environment to provide external access to a sample web application.

Problem Statement

As applications within a Kubernetes cluster grow, the need for external access becomes paramount. Traditional methods, such as NodePort Services, can expose services, but they lack advanced routing capabilities. Ingress solves this problem by providing a single entry point to your applications, allowing for better management and easier access.

Prerequisites

Completion of all previous lab guides (up to Lab Guide-06) is required before proceeding with Lab Guide-07.

- Minikube installed on your Windows machine.
- **kubectl** command-line tool installed and configured to communicate with your Minikube cluster.
- Ensure your Minikube version is compatible (at least Kubernetes v1.19).

Setup Instructions

Step 1: Create a Minikube Cluster

1. Start Minikube

Open PowerShell or Command Prompt as Administrator and run:

minikube start

```
C:\Windows\System32>minikube start

* minikube v1.34.0 on Microsoft Windows 11 Home Single Language 10.0.22631.4317 Build 22631.4317

* Using the docker driver based on existing profile

* Starting "minikube" primary control-plane node in "minikube" cluster

* Pulling base image v0.0.45 ...

* Restarting existing docker container for "minikube" ...

! Failing to connect to https://registry.k8s.io/ from inside the minikube container

* To pull new external images, you may need to configure a proxy: https://minikube.sigs.k8s.io/docs/reference/networking/proxy/

* Preparing Kubernetes v1.31.0 on Docker 27.2.0 ...

* Verifying Kubernetes components...

* After the addon is enabled, please run "minikube tunnel" and your ingress resources would be available at "127.0.0.1"

- Using image registry.k8s.io/ingress-nginx/kube-webhook-certgen:v1.4.3

- Using image registry.k8s.io/ingress-nginx/kube-webhook-certgen:v1.4.3

- Using image registry.k8s.io/ingress-nginx/kube-webhook-certgen:v1.4.3

- Using image gcr.io/k8s-minikube/storage-provisioner:v5

* Verifying ingress addon...

* Enabled addons: storage-provisioner, ingress, default-storageclass

* Done! kubectl is now configured to use "minikube" cluster and "default" namespace by default
```

This command will create a local Kubernetes cluster.

Step 2: Enable the Ingress Controller

1. Enable NGINX Ingress Controller

Run the following command in your terminal:

```
minikube addons enable ingress

C:\Windows\System32>minikube addons enable ingress

* ingress is an addon maintained by Kubernetes. For any concerns contact minikube on GitHub.

You can view the list of minikube maintainers at: https://github.com/kubernetes/minikube/blob/master/OWNERS

* After the addon is enabled, please run "minikube tunnel" and your ingress resources would be available at "127.0.0.1"

- Using image registry.k8s.io/ingress-nginx/kube-webhook-certgen:v1.4.3
```

2. Verify the Ingress Controller is Running

Verifying ingress addon...
The 'ingress' addon is enabled

After a few moments, verify that the Ingress controller is running with:

- Using image registry.k8s.io/ingress-nginx/kube-webhook-certgen:v1.4.3

```
kubectl get pods -n ingress-nginx
```

C:\Windows\System32>kubectl get pods -n ingress-nginx			
READY	STATUS	RESTARTS	AGE
0/1	Completed	0	6s
0/1	Completed	1	5s
0/1	Running	0	6s
	READY 0/1 0/1	READY STATUS 0/1 Completed 0/1 Completed	READY STATUS RESTARTS 0/1 Completed 0 0/1 Completed 1

You should see the NGINX Ingress controller listed and running.

Step 3: Deploy a Hello World Application

1. Create a Deployment

Deploy a sample Hello World application:

kubectl create deployment web --image=gcr.io/google-samples/hello-app:1.0

PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl create deployment web --image=gcr.io/google-samples/hello-app:1.0 deployment.apps/web created

Confirm the deployment is successful by running:

```
kubectl get deployment web
```

```
PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl get deployment web

NAME READY UP-TO-DATE AVAILABLE AGE
web 1/1 1 23s
```

2. Expose the Deployment

Expose the deployment with NodePort:

```
kubectl expose deployment web --type=NodePort --port=8080
```

PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl expose deployment web --type=NodePort --port=8080 service/web exposed

3. Verify the Service

Check the service to ensure it's available:

```
kubectl get svc web
```

```
PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl get svc web

NAME TYPE CLUSTER-IP EXTERNAL-IP PORT(S) AGE

web NodePort 10.107.37.46 <none> 8080:30715/TCP 23s
```

Note the NodePort assigned to the service.

Step 4: Create the Ingress Resource

1. Create an Ingress YAML File

Create a file named example-ingress.yaml with the following content:

```
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
   name: example-ingress
   annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /
spec:
```

2. Apply the Ingress Resource

Use the following command to create the Ingress:

```
kubectl apply -f example-ingress.yaml
```

PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl apply -f example-ingress.yaml ingress.networking.k8s.io/example-ingress created

3. Verify the Ingress

Check the status of the Ingress:

```
kubectl get ingress
```

```
PS D:\GuideLabs\Guided_Labs\Kubernetes\k8s_Example> kubectl get ingress

NAME CLASS HOSTS ADDRESS PORTS AGE
example-ingress nginx hello-world.example 80 25s
```

Note: It may take a minute to assign an address.

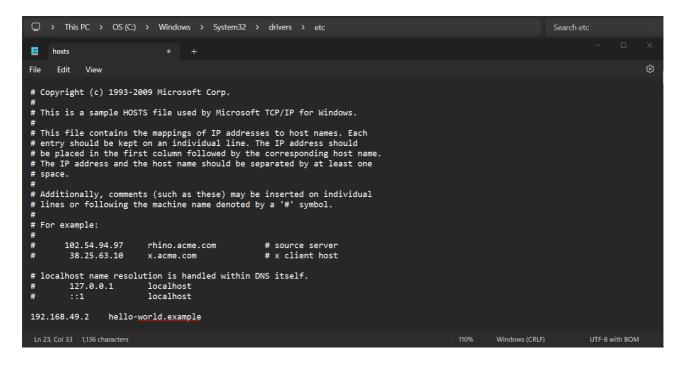

Step 5: Test the Ingress

1. Update the Hosts File

Open the hosts file with administrative rights (located at

C:\Windows\System32\drivers\etc\hosts) and add the following line using the IP address returned by minikube ip:

```
C:\Windows\System32>minikube ip
192.168.49.2
```

```
<minikube-ip> hello-world.example
```

Replace <minikube-ip> with the actual IP address from the previous command.

2. Test the Ingress

Visit the Service via NodePort, using the minikube service command:

```
minikube service web
```

The above command will open the sample application.

The output is similar to:

Hello, world! Version: 1.0.0

Hostname: web-56b9569dcc-48zbn

Note: On Linux System we can test ingress using Minikube IP address instead of Localhost i.e., 127.0.0.1
